How accurate is the equate home drug test

Aside from launching a legal challenge, your best defense against urine testing is to be clean. Unfortunately, this may be difficult since urine tests may detect marijuana 1-5 days after an occasional use, 1-3 weeks in regular users, and 4-6 weeks in multiple daily users. Can a very faint line be positive? Any positive line, no matter how faint, means your result is pregnant. Levels of hCG in your body will increase over the course of your pregnancy. If you test early, your hCG levels may be still be low and you'll see a faint positive line. READ: Is slow processing speed genetic?How accurate is equate drug test? Get fast results in the privacy of your own home with Equate™ Home Drug Tests. This home testing kit can screen for up to 12 commonly abused drugs in five to 10 minutes to give you results that are accurate 99 percent of the time. Why is line faint on drug test? Drug tests shouldn't be viewed in the same manner as a pregnancy test, where even a faint line indicates a positive result. Instead, drug tests with faint lines mean the result is negative. If you have an employee test for marijuana and opioids in their test and there are faint lines on both, the test is negative. READ: Which way up do you plant an acorn?Is home drug test as accurate as lab? How accurate are these tests? The at-home testing part of this test is fairly sensitive to the presence of drugs in the urine. This means that if drugs are present, you will usually get a preliminary (or presumptive) positive test result. Laboratory tests are the most reliable way to confirm drugs of abuse. What does the C and T stand for on a drug test? POSITIVE: A colored line appears in the Control region (C) and NO line appears in the Test region (Drug/T) next to the name of a specific drug tested. The positive result means that the drug concentration in the urine sample is greater than the designated cut-off for a specific drug. READ: Can you bathe a pregnant dog with flea shampoo?Can barely see line on drug test? Are lab drug test harder to pass? Lab based testing is known to be the more accurate of the two. Labs will do a test or screening of a specimen similar to the rapid test. If there is detection of a drug, a very scientific method called gas chromatography-mass spectrometry is performed to confirm the findings. Does a very faint line mean positive drug test? Is the Dollar Tree drug test accurate? Are these tests accurate? The box says the test is "97 percent accurate" with results within five minutes after dipping the single-use strip into a urine sample. It shows a simple plus or minus to tell if the sample is positive or negative for having tetrahydrocannabinol (also known as "THC") in the body. Drug testing is common and failing a drug screening for work can only have negative outcomes. Failing a drug test because will leave you with a lot of explaining to do between you and your employer. We wanted to see if CBD oil would pass or fail in some of the more popular drug tests. CBD supplementation has gained heavy traction as of late as a natural remedy for pain & inflammation relief, improved quality of sleep, and has shown to help with general anxiety. CBD, or cannabidiol, is one of the many compounds derived from the hemp plant. Most CBD products contain small traces of tetrahydrocannabinol (THC). CBD products are federally legal but some states still do not allow them. To see which states allow CBD, see our frequently updated CBD State Laws article. THC is another compound found in hemp that is also present in medical marijuana. THC makes you high and is considered an illegal substance in the corporate workplace. Alternatively, CBD products do not make you high. We were curious to see how an avid CBD user would fare when taking two popular drug tests. In this article, we are going to see if taking CBD can lead to a positive drug test. Meet Laura Laura has been supplementing CBD hemp oil for the past 4 months to help with lower back pain. We reached out to her because she is a good representative of a consistent CBD user. Laura is 5'1 and weighs 115 lbs. Laura currently does not take any other prescription drugs or medications. Be sure to read our CBD Drug Interactions to see if CBD supplementation is safe with your prescription drugs. Laura's CBD source Disclaimer: All full spectrum CBD products contain small amounts of THC. The federal government says products containing less than 0.03% is legal. Below is the link to Laura's lab report. Batch: 100015 | Urbul Blood Orange Hemp Tincture 30ml 1000mg Laura's current dosage Total CBD consumed is 20mg, taken twice daily Serving one is taken every morning at 8:00 am. Serving two is taken every night before bed at 9:00 pm. Laura has agreed to take both tests so we can better educate the CBD community about drug testing in regard to CBD supplementation. Home Drug Tests from First Check and Equate We decided to use two widely available take-home tests from First Check and Equate. The tests we are using are single panel and only test for Marijuana. How do these drug tests work? Both home urine tests compose of 4 steps. Collect a urine sample in the given container. Attach container lid. The lid itself is what tests the urine sample. Wait 5 minutes & read the preliminary result. For the official result, mail the sealed container to the lab with the attached identification number. How to interpret the results Understanding the results is pretty straightforward. Both tests use this standardized layout. You can read results after 5 minutes but it is not advised to wait longer than 10 minutes. There must be a red line next to Control (C) to indicate the test worked properly. If a second line appears under Control (C), then the result is negative. This line may be lighter in color or thinner than the control line. If no line appears under Control (C), then the result is preliminary positive. In this case, the entire test container should be sent in for confirmation from the lab. Why we chose First Check and Equate First Check is the most popular take-home test that claims to be 99% accurate. Their lab analyzes over 70,000 urine specimens a day using Gas Chromatography/Mass Spectrometry (GC/MS) as their testing method. This method is known as the gold standard in laboratory testing for most drugs. First Check is cleared by the FDA and was voted the #1 Pharmacist recommended brand according to 2010-2019 Pharmacy Times Annual Pharmacists Recommended OTC Survey. We chose Equate as the second test because of how available it is. Equate products are available across all Wal Mart stores nationwide. Their test also boasts 99% accurate and is cleared by the FDA. Taking the test Here are Laura's id numbers for each test. First Check Identification Number: 201 845 035 Equate Confirmation Label: E010480054 Laura followed the provided instructions. What happened next was unexpected. Both tests were taken at the same time and day. Preliminary results showed positive for THC Initial results for both tests came in as Preliminary Positive. This is positive because there is no line under the Control line. We were shocked to see this as the CBD community claims you will always pass drug tests due to cannabidiol products containing very low amounts of THC. Upon seeing this result, Laura sent both tests to their respective labs for more information. Turnaround time is about 3-5 business days. Official lab results remain negative for both tests The actual results from the lab came back about a week later. The lab did not test positive for marijuana even though the preliminary result did. Notice that both lab results match our identification numbers from earlier in this article. First Check Identification Number: 201 845 035 Equate Confirmation Label: E010480054 Both results were opposite of the preliminary results which was weird to all of us. We decided to email both companies to find out more. The results from both tastes came back negative. A negative result means that THC was not found there is just not enough drug present to confirm a positive result (50 nanograms/milliliter). We emailed First Check for clarification. Here's what they said. We were confused about the false positive drug test so we emailed First Check for more information. I received a response in a few hours from First Check. Equate has a customer service line available for questions. Our inquiry I received a POSITIVE on the home screening portion of the test for marijuana (THC) and NEGATIVE when I sent it in to your laboratory. What does this mean? First Check's answer It is possible to get a Positive Test Result at home and a Negative at the laboratory. The home portion of the test is considered a preliminary screening which tests for a group of metabolites. At the lab, our GC/MS equipment tests for one specific metabolite called delta-9-tetrahydrocannabinol (THC). The home portion has a higher cut-off level than GC/MS; however the sensitivity of the two testing methods is similar. Since the home portion of the test is meant to screen for a group of marijuana metabolites in urine, you may get a Positive at home and a Negative at the laboratory if there is not enough of the one specific metabolite being tested to cause a positive result in the laboratory. Samples at or near the cut-off level contain the greatest margin of error. Please note: It is highly unlikely that you would get a Positive result on the home portion of the test unless there were traces of marijuana in the urine (or another substance or medication was cross-reacting to cause a Preliminary Positive test result). There are a few known over-the-counter medications, prescription drugs and other substances which can cross-react with the First Check Home Drug Test to cause a preliminary positive test result for marijuana (THC) on the home portion of the test. There is no accurate list available and if this situation occurs, confirmatory testing will rule that out. Understanding the take-home test The email above suggests that traces of Marijuana was definitely present in the test sample. The take-home test analyzes the urine sample differently than lab testing. This is why results are mixed. The take-home test checks for a group of marijuana metabolites such as THCA and 9-carboxy-THC. If present, the preliminary results are positive, otherwise the preliminary results are negative. Laura's initial result was preliminary positive result because all full spectrum CBD products contain trace amounts of THCA / 9-carboxy-THC. The labs only test for one specific metabolite: delta-9 tetrahydrocannabinol (THC). THC amounts over 50 ng/ml result as positive, under 50 ng/ml is negative. Laura's lab result is negative because the amount of THC found was less than 50 ng/ml. THC is the psychoactive cannabinoid that makes you high. This is important to know because CBD products must have zero or low (0.3%) amounts of THC to be legally sold. We believe traces of THC metabolites were found in the urine sample. When tested in the lab, the amount of specifically THC was under the SAMHSA limit of 50 ng/ml resulting in a negative result. Our advice going forward: Tread carefully If you use full spectrum CBD products, we strongly suggest that you tread carefully if you frequently take drug tests. We cannot accurately tell you what a safe dosage is because everybody's body composition is different. Trace amounts of THC in full spectrum CBD oil are definitely being noticed without a doubt. Whether or not they pass a lab's test will ultimately depend on serving sizes and bodyweight. The following factors can directly affect your lab test results: Low quality full spectrum CBD - make sure to do your due diligence when picking a CBD product. Make sure the THC content is under the legal limit of 0.3%. CBD dosage size - Laura uses 20mg per day. The amount of THC in your system increases as your full spectrum CBD consumption increases. Body composition - Physical makeup such as weight, height, and age varies significantly. Different types of CBD - We believe CBD topicals will not affect THC levels in your blood as much as edibles and tinctures. Unfortunately, both labs do not disclose exactly how much THC was found in the test sample. We simply know it was low enough to for a negative result. There are many benefits of choosing full spectrum CBD products. The other cannabinoids found in the cannabis plant aside from cannabidiol are also beneficial and work better when supplemented together. This is known as the entourage effect. However, if you prefer to completely separate yourself from any trace amounts of THC, consider CBD isolate products. People use CBD isolate to remove all risk of ever failing a drug test. Isolate products have an extremely low percent THC that will show up as ND (not detected) on drug tests. CBD isolate simply means the cannabinoind CBD is separated from the rest of the cannabinoids that are present in full spectrum CBD products. Some of these include THC-A, THC-V, CBD-A, CBC, CBN, CBG. If you're interested in CBD isolate, consider some of Urbul's CBD isolate products. Our American grown hemp is harvested across 900 acres of land and extracted in Colorado. Our products are distributed across the United States and every product comes with 3rd party lab reports. Urbul Vegan Hemp CBD Gummies 900 mg of pure CBD isolate THC free Urbul CBD Vape Starter Kits Portable vape system Disposable flavor pods, each pod contains 250 mg of pure CBD isolate 6 handcrafted flavors Final thoughts Daily consumption of 20 mg full spectrum CBD oil did not trigger raise any red flags in the actual lab reports. Laura's CBD dosage is pretty standard and it helps that she takes her dosages on a consistent schedule. CBD lasts in your body for 3-7 days so it's important to follow a consistent dosage schedule if you are looking for accurate data. It would be harder to make any deductions if our subject supplemented CBD at different times of the day with different serving sizes. In the future, we'd like to see additional testing from CBD users who consume higher dosages. It's understandable why companies test for drug use. Substance abuse statistically is a precursor for bad habits and lower productivity. It's unfortunate that CBD falls into this category because the use of CBD helps deal with stress, inflammation, chronic pain, and sleep. Because CBD is derived from the cannabis plant, there will always be levels of THC present in full spectrum CBD products. For more information, feel free to contact us if you have any questions or concerns regarding CBD supplementation. Take our CBD Quiz to see which CBD products fit your needs and lifestyle.
